

## ABSTRACT

This study evaluated the bioinsecticide activity of organic extracts of *Bursera copallifera* and *B. grandifolia* on L1 larvae of *Spodoptera frugiperda*. It is likely that the acetonic extract (500 ppm) of leaves of *B. copallifera* had an effect as an antifeedant on armyworm, causing a 50% reduction in larval weight at 14 days. It also produced 47% larval mortality, whereas the hexane extract produced 44% deformed pupae, and of the population that emerged from pupae, 14% were deformed as adults. Acetone and methanol extracts of leaves of *B. grandifolia* produced 37 and 45% larval mortality at 14 days, respectively, whereas the hexane extract from stems caused a larval mortality of 37% over the same period.
